SESSION SUMMARY

SITE: Walled City and Fortress in desert (Iran)

.....perceived that site consisted of tall vertical cliffs or mountain of natural, rough texture... colors of browns, earthones, range... feeling of warm.... something at base felt curved, concave, dark.... perception of angles, squares, rectangles, structures..... structures at the base of this tall vertical formation..... site was very quiet (site abandoned in 1850) with only the sounds of birds chirping perceivable..... the only A.I. was a feeling of tall, vertical, but this was fairly weak and did not have significant impact. While sketching the site in the left brain mode there was a temptation to "label" the site a Southwest Cliff Dwelling, but this thought was regarded by viewer as (pure AOL) and (discarded)* (cliff dwellings are located above the base of cliffs, not at the base).

must start objectifying;

.....it is also interesting to note that the fortress and walls of this site are constructed with [redacted] sun-dried brick.

even if you can successfully block aol "interference" you must be able to AOL-MATCH

Also, AOL's may be of importance to an analyst.

..... a slight disorientation occure when I am able to pick up the signal line and hang on to it, even during breaks and following a session. ...I suspect that this means there is still contact with the signal line and a portion of the viewers subconscious is still linked to the site.....its' kind-of like a "runners high"....I guess we could label this a "viewers' high".

* this did not occur to viewer until after session
